Sandra Chirico

The human body encounters many forms of bacteria every day. Generally the body is successful at blocking away bacteria and germs that can make us very sick. During certain seasons when cold and flues are most prominent we become more susceptible to getting sick. The use of Anti bacterial sanitizer and hand washing helps to a certain extent but with our busy schedules we tend to forget to take these precautions.

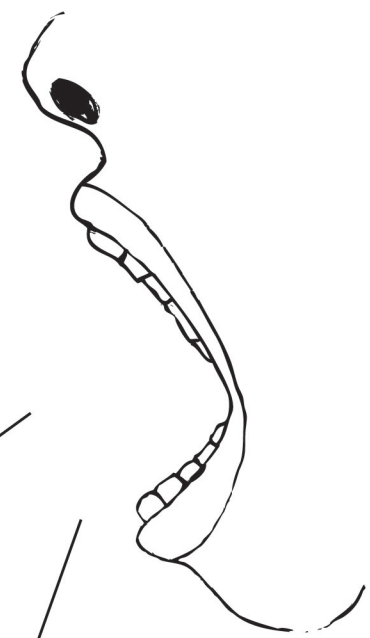

My smart object consists of 3 accessories when worn just look like a headband, necklace and wristbands. These objects have components that release a micro force field once the activation button is pressed from any of the 3 accessories. It can be left on at all times or just activated when they come across a possible viral risk.

...choooo!

The face and hands become protected with out any cumbersome masks and the person's identity is still visible. As an everyday object it might be seen as something that might feed germ paranoia and single out people around you who may be sick and create social barriers. It can be a useful device for healthcare workers who are exposed to more viral bacterial diseases. It can keep them healthy not only from catching something but also from passing germs around.
